

6. Get Accurate Data for Better Decision Making

With Florisynergy, you can easily generate detailed reports on plant survival, grafting productivity, and propagation volumes per variety. These reports help you make informed decisions about future propagation cycles, improving profitability and operational planning.

How It Works: A Seamless Process from Start to Finish

1. Create Propagation Order

Initiate each order digitally and track every resource allocation—from budwood to plants ensuring no manual errors.

2. Track Budwood Harvesting

Use the app to monitor the exact amount of budwood harvested, preventing over-harvesting and ensuring you only take what you need.

3. Grafting and Nursery Management

Move your harvested budwood to the grafting stage and track grafting progress. Once grafted, monitor plant health and remove dead or damaged plants to keep your nursery healthy.

4. Manage Hardening & Dispatch

Once plants have been hardened, the system tracks any losses and prepares plants for dispatch, providing real-time updates on plant readiness. Generate delivery notes with complete accuracy, ensuring timely delivery to your growers.

5. Track and Improve Grafting Performance

By capturing each grafter's performance, you can track grafting efficiency and improve your team's productivity.

What You Get with Florisynergy:

- Centralized Order Management: Easily track and manage propagation orders from a single platform.
- Real-Time Visibility: Monitor every step of the process with up-to-date reports on plant health, survival rates, and stock levels.
- Cost Savings: Prevent over-harvesting, reduce plant loss, and optimize resource allocation to save on materials and labor.
- Improved Productivity: Track grafting output, nursery performance, and team efficiency to boost overall productivity.
- Streamlined Workflow: Transition smoothly from one propagation stage to the next with no disruptions.
